Exam details *[1]*

Title: Java SE 8 Programmer I

Exam Id: 1Z0-808

Duration: 150

Duration: 150

No. question: 70

Passing score: 65%

Assume the following (1 of 5) [1]

Missing package and import statements: If sample code do not include package or import statements, and the question does not explicitly refer to these missing statements, then assume that all sample code is in the same package, or import statements exist to support them.

Assume the following (2 of 5) [1]

No file or directory path names for classes: If a question does not state the file names or directory locations of classes, then assume one of the following, whichever will enable the code to compile and run:

- All classes are in one file
- Each class is contained in a separate file, and all files are in one directory

Assume the following (3 of 5) [1]

Unintended line breaks: Sample code might have unintended line breaks. If you see a line of code that looks like it has wrapped, and this creates a situation where the wrapping is significant (for example, a quoted String literal has wrapped), assume that the wrapping is an extension of the same line, and the line does not contain a hard carriage return that would cause a compilation failure.

Assume the following (4 of 5) [1]

Code fragments: A code fragment is a small section of source code that is presented without its context. Assume that all necessary supporting code exists and that the supporting environment fully supports the correct compilation and execution of the code shown and its omitted environment.

Assume the following (5 of 5) [1]

Descriptive comments: Take descriptive comments, such as "setter and getters go here," at face value. Assume that correct code exists, compiles, and runs successfully to create the described effect.

Java Basics [1]

- Define the scope of variables
- Define the structure of a Java class
- Create executable Java applications with a `main` method; run a Java program from the command line; produce console output
- Import other Java packages to make them accessible in your code
- Compare and contrast the features and components of Java such as: platform independence, object orientation, encapsulation, etc.

Working With Java Data Types [1]

- Declare and initialize variables (including casting of primitive data types)
- Differentiate between object reference variables and primitive variables
- Know how to read or write to object fields
- Explain an Object's Lifecycle (creation, "dereference by reassignment" and garbage collection)
- Develop code that uses wrapper classes such as `Boolean`, `Double`, and `Integer`

Using Operators and Decision Constructs [1]

- Use Java operators; use parentheses to override operator precedence
- Test equality between Strings and other objects using `==` and `.equals()`
- Create `if` and `if / else` and ternary constructs
- Use a `switch` statement

Creating and Using Arrays *[1]*

- Declare, instantiate, initialize and use a one-dimensional array
- Declare, instantiate, initialize and use multi-dimensional arrays

Using Loop Constructs [1]

- Create and use `while` loops
- Create and use `for` loops including the enhanced for loop
- Create and use `do / while` loops
- Compare loop constructs
- Use `break` and `continue`

Working with Methods and Encapsulation [1]

- Create methods with arguments and return values; including overloaded methods
- Apply the `static` keyword to methods and fields
- Create and overload constructors; differentiate between default and user defined constructors
- Apply access modifiers
- Apply encapsulation principles to a class
- Determine the effect upon object references and primitive values when they are passed into methods that change the values

Working with Inheritance [1]

- Describe inheritance and its benefits
- Develop code that makes use of polymorphism; develop code that overrides methods; differentiate between the type of a reference and the type of an object
- Determine when casting is necessary
- Use `super` and `this` to access objects and constructors
- Use abstract classes and interfaces

Handling Exceptions [1]

- Differentiate among checked exceptions, unchecked exceptions, and Errors
- Create a `try / catch` block and determine how exceptions alter normal program flow
- Describe the advantages of Exception handling
- Create and invoke a method that throws an exception
- Recognize common exception classes (such as `NullPointerException`, `ArithmeticException`, `ArrayIndexOutOfBoundsException`, `ClassCastException`)

Working with Selected classes from the Java API [1]

- Manipulate data using the `StringBuilder` class and its methods
- Create and manipulate Strings
- Create and manipulate calendar data using classes from `java.time.LocalDateTime`, `java.time.LocalDate`, `java.time.LocalTime`, `java.time.format.DateTimeFormatter`, `java.time.Period`
- Declare and use an `ArrayList` of a given type
- Write a simple Lambda expression that consumes a Lambda Predicate expression
